

ABSTRACT

When a brake is released by worker's operation, a subject automatic machine is specified so as to prevent an accident due to an error, such as misconception.

An automatic machine control device includes a brake releasing unit that releases a brake when a motor is not driven, and a brake release indication unit that is provided on the automatic machines or in the vicinities of the automatic machines. When brake releasing is made by worker's operation, the fact is indicated on the brake release indication unit of a subject automatic machine.
